MOUNTING

As shown in picture 1, when the sensor is installed in static water such as in pools, water towers, probe is immersed into the bottom and should be as far as possible away from the pump or valves.

As shown in picture 2, when the sensor is installed in dynamic water such as dams or rivers, probe should be inserted into a steel pipe (inner dia is around 45mm), burrowing several holes at different height on the pipe side wall which is opposite to the water flow direction.

► Multi-Plate Radiation Shield

The Multi-Plate Radiation Shield protects temperature, relative humidity or barometric pressure sensors from error-producing solar radiation and precipitation. The radiation shield reflect sunlight from any direction, prevent sun direct radiation and reflection on the ground to the sensor radiation, to protect the instrument from the effects of strong winds, rain, snow, etc. Freely through the air, making instrument work in ventilated environment, to ensure the accuracy of measured data. Products with high reflectivity and low thermal conductivity, resistance to ultraviolet ray function, can be used in extreme weather conditions.
